

The relationships I chose were zero or many for the concessions. This way the customer can have multiple concessions or none at all. For customer to checkout and order to checkout, there can only be one customer and one checkout per order. so I chose the one and only one option for both ends. For the theater, movie, and showing, I chose one to one as I did not want to allow multiple movies on one ticket. The ticket option is one or many as they can have multiple tickets for the same movie.
